INVESTOR BRIEF · 2026

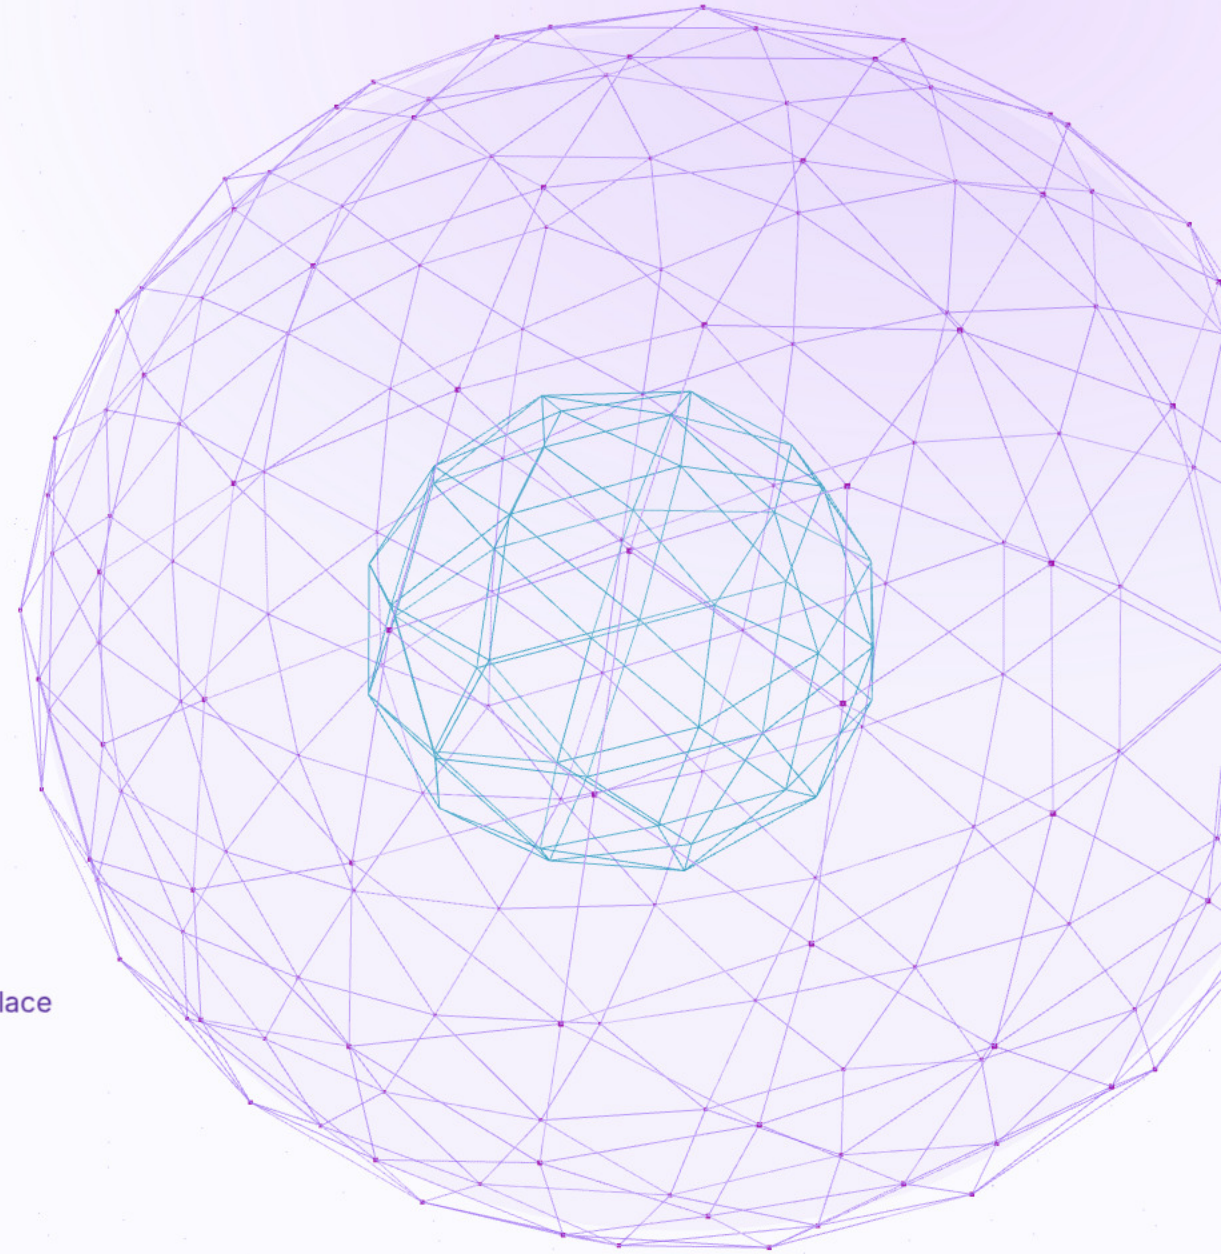

Own your intelligence.

Sovra gives every person and every company **total control** of their data, their models and their memory — running on the computers they already own.

TODAY
Native app · macOS · Windows · Linux

NEXT
Private company fleets

THEN
Models trained in place

WHAT WE BELIEVE

Your data stays yours.
Your model is your choice.
Your memory comes with proof.
Your company is the network.

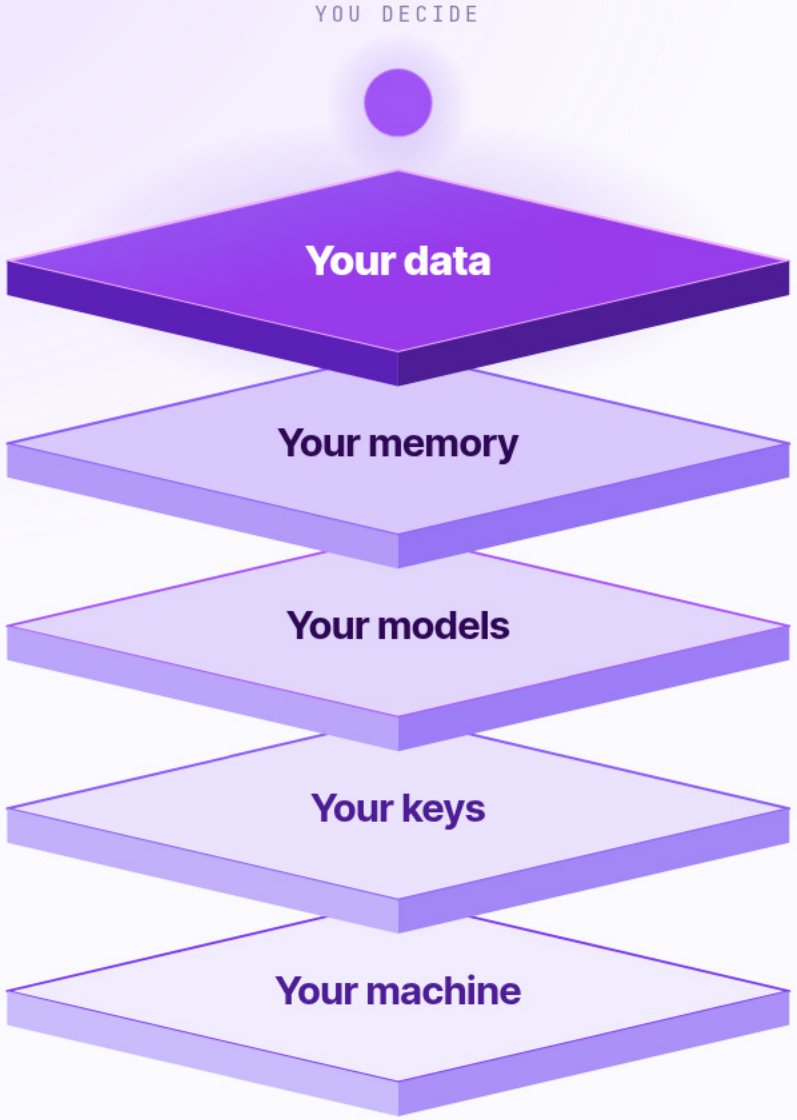

Sovereign AI, made simple enough for anyone to use.

THE PROBLEM

AI is rented. Your knowledge pays the rent.

- **It forgets**
  Every chat starts blank. You pay again to teach it who you are.
- **It locks you in**
  Their model, their price, their outage. When the service stops, the work stops.
- **It leaks**
  To be useful, your files and your company's story move into **someone else's cloud**.

SOVEREIGNTY, DEFINED

Sovereign means owning every layer.

DATA	Folders are read **in place**. The original files are never changed or moved.	TODAY
MEMORY	An embedded database **on your disk**. Every detail opens to its source.	TODAY
MODELS	Ollama, LM Studio, vLLM, llama.cpp — or a cloud **you** pick.	TODAY
KEYS	In the OS keychain. Never written into a config file.	TODAY
MACHINE	One native program on the computer you already own.	TODAY

TIMING

Three curves just crossed.

RISING

Open models fit on a laptop

Models you can download now run on **a graphics card, a Mac, or the main chip**, and are good enough for real work.

RISING

Every desk already has the chip

Companies own fleets of computers that sit **idle most of the day**. The compute is already paid for.

FALLING

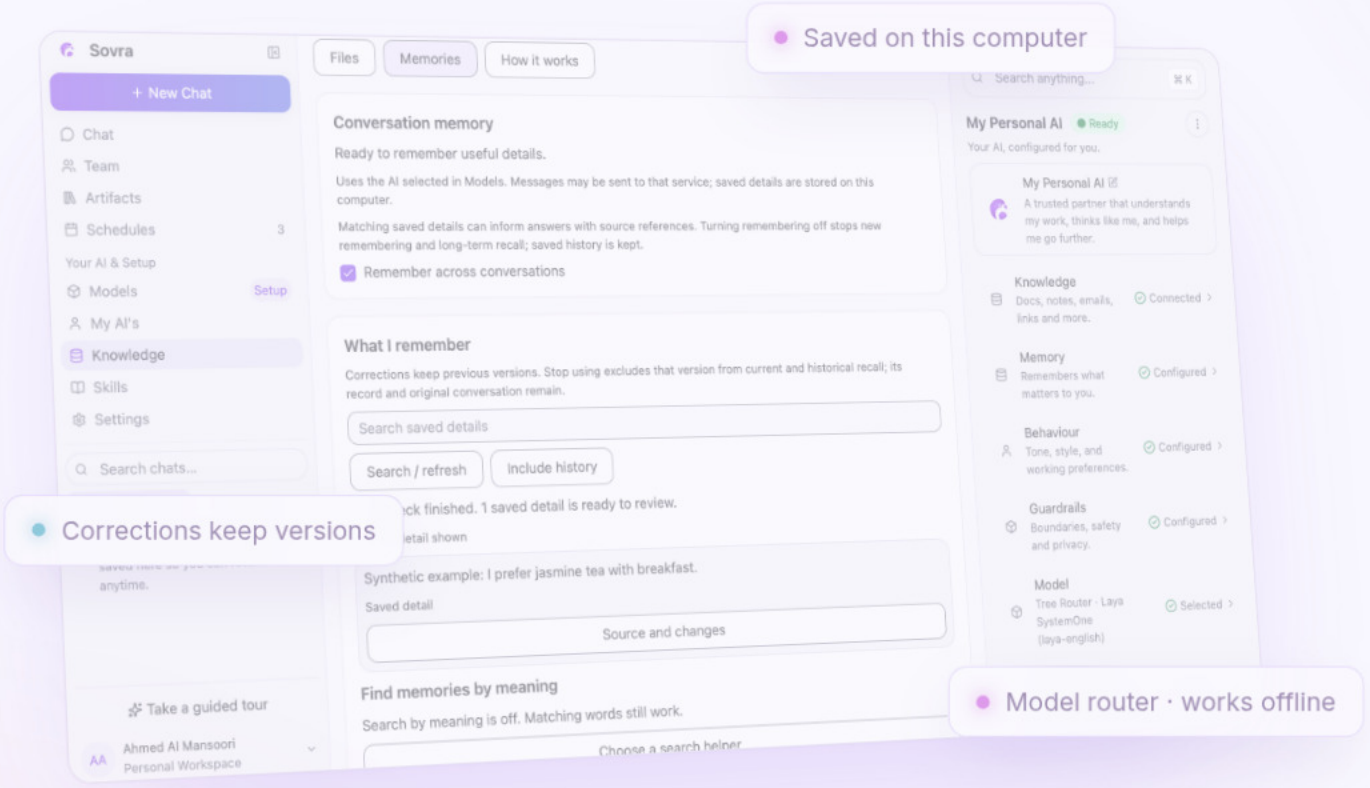

Willingness to send data away

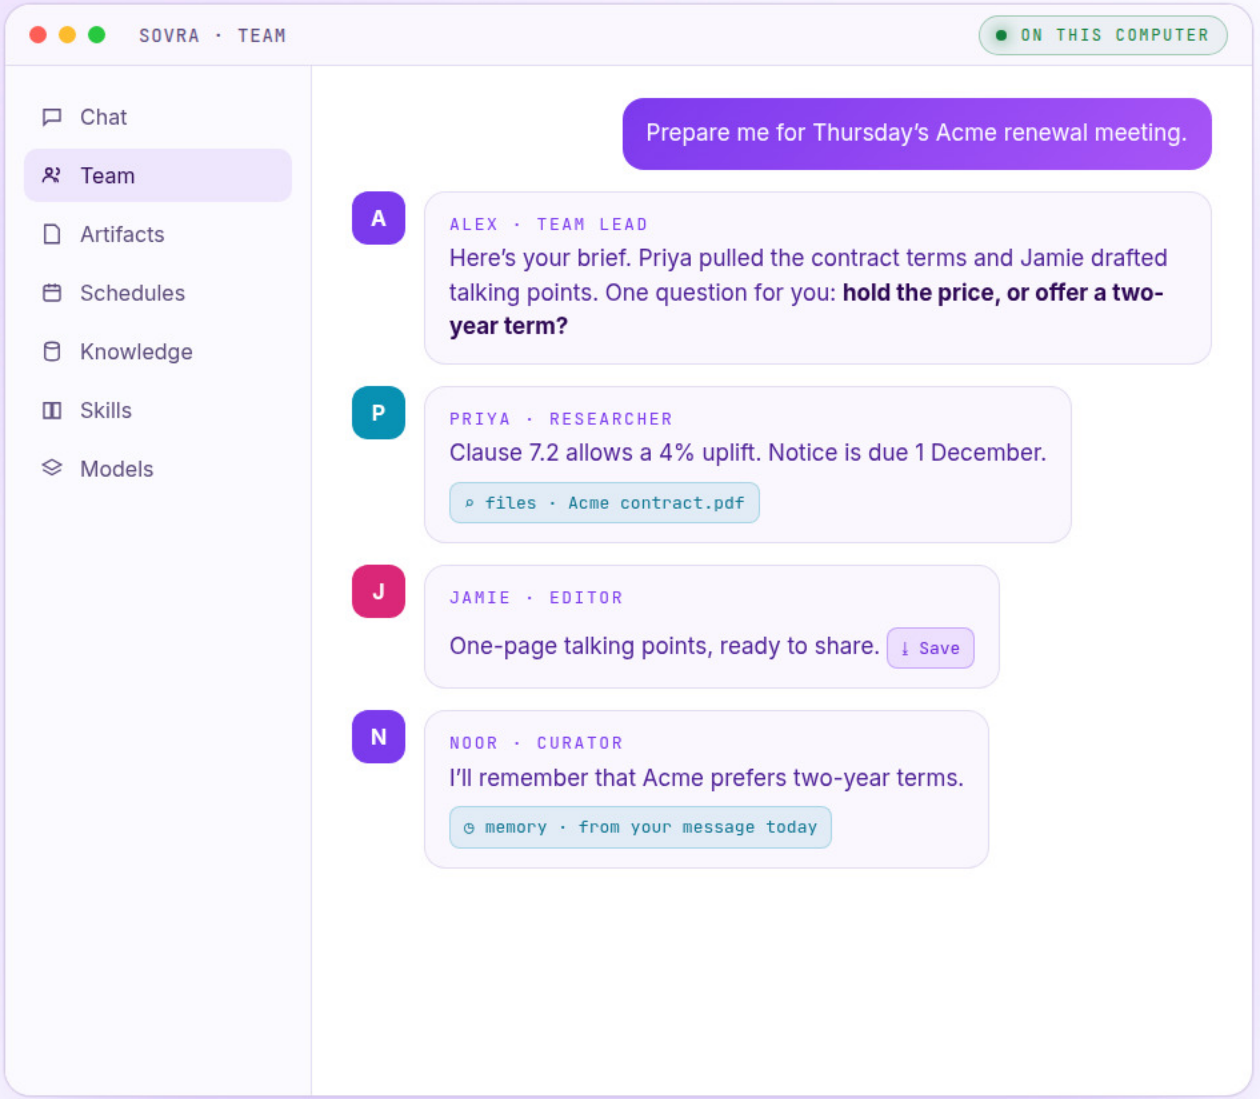

Boards, regulators and customers want the company's knowledge to **stay where it is**.

PART ONE · TODAY

A sovereign computer. Already shipping.

Everything in this part runs in the native app today, on macOS, Windows and Linux.

Files
Memories
How it works
Conversation memory
Ready to remember useful details.
Uses the AI selected in Models. Messages may be sent to that service; saved details are stored on this computer.
Matching saved details can inform answers with source references. Turning remembering off stops new remembering and long-term recall; saved history is kept.
Remember across conversations
What I remember
Corrections keep previous versions. Stop using excludes that version from current and historical recall; its record and original conversation remain.
Search saved details
Search / refresh
Include history
Synthetic example: I prefer jasmine tea with breakfast.
Saved detail
Source and changes
Find memories by meaning
Search by meaning is off. Matching words still work.
Search anything...

TODAY · A TEAM, NOT A CHATBOT

A whole team, in one chat.

12

NAMED TEAMMATES

Eight ready to go, four to add, and you can make your own.

23

SPECIALIST ROLES

Each one switches on when the tool it needs is connected.

49

BUILT-IN SKILLS

Each has a **Try an example** button. No commands to learn.

9

KINDS OF SAVED WORK

Documents, tables, code, diagrams, pictures and more, all with versions.

TODAY · THE SKILLS PAGE

Simple enough for your gran.
Deep enough for your engineers.

LETTERS

Write a letter

"Write a polite letter to my landlord about the broken boiler."

Try an example

HOME

Find a home

"What do two-bed flats near the park cost right now?"

Try an example

RESEARCH

Look anything up

"What changed in the pension rules this year?"

Try an example

FILES

Search my files

"Find the warranty for the washing machine."

Try an example

MESSAGES

Send a message later

"Text Sam 'good luck today' at 8am on Friday."

Try an example

MONEY

Make a spreadsheet

"Turn my receipts into a monthly budget table."

Try an example

MARKETS

Check the markets

"How did my three shares do this week?"

Try an example

CODING

Coding helper

"Why does this script fail when the folder is empty?"

Try an example

PLAIN WORDS

"Helper", not "agent". **"Save"**, not "export". Deletes ask twice. Built-in helpers switch off instead of disappearing. **Nobody loses work.**

TODAY · MEMORY YOU CAN OPEN

Memory with receipts.

Every detail keeps the message that taught it. A correction **replaces** the detail, and the old one stays as history.

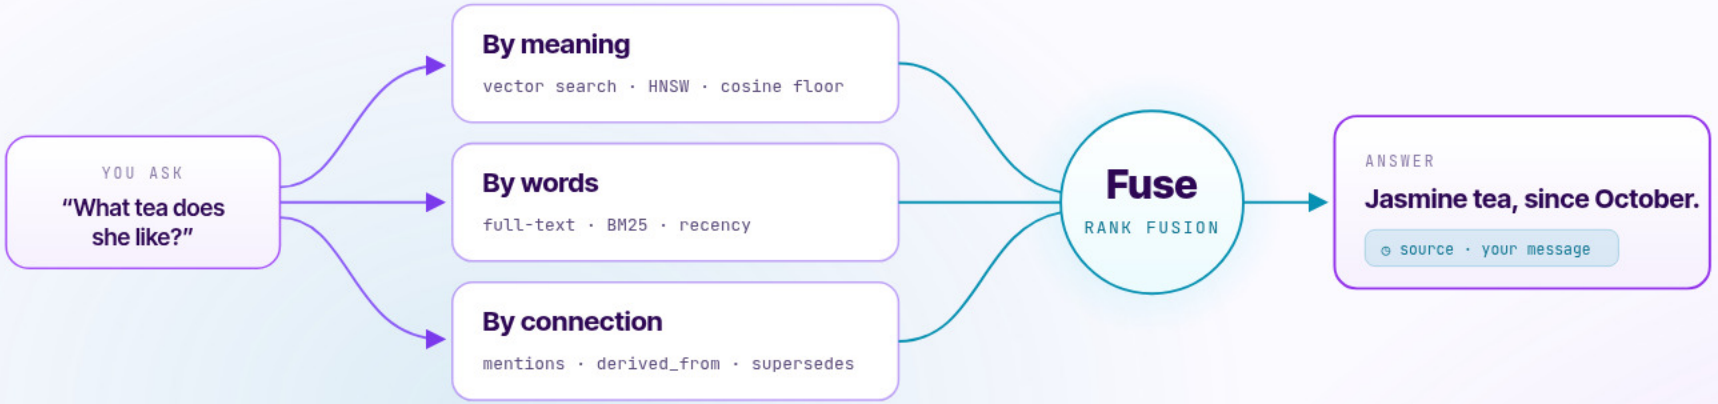

- Open the original message
- Correct → a new version
- Stop using → record is kept
- Ask what was believed, and when

REMEMBER THIS

Facts are **superseded, never deleted**, each with four timestamps and a source. That is the shape of a **ledger**, and we come back to it in part two.

TODAY · UNDER THE HOOD

Vectors, graph and full text in one engine, on your disk.

Two-second budget

If meaning search is slow it falls back to words **and tells you so**. You always get an answer.

Bring your own meaning model

Meaning search is opt-in. Point it at a **local Ollama** model or a service you choose.

Built to be checked

Quotes are checked word for word, jobs survive a restart, and the same message is never saved twice.

TODAY · YOUR FILES, UNDERSTOOD

Your files become knowledge. You approve every link.

Read in place

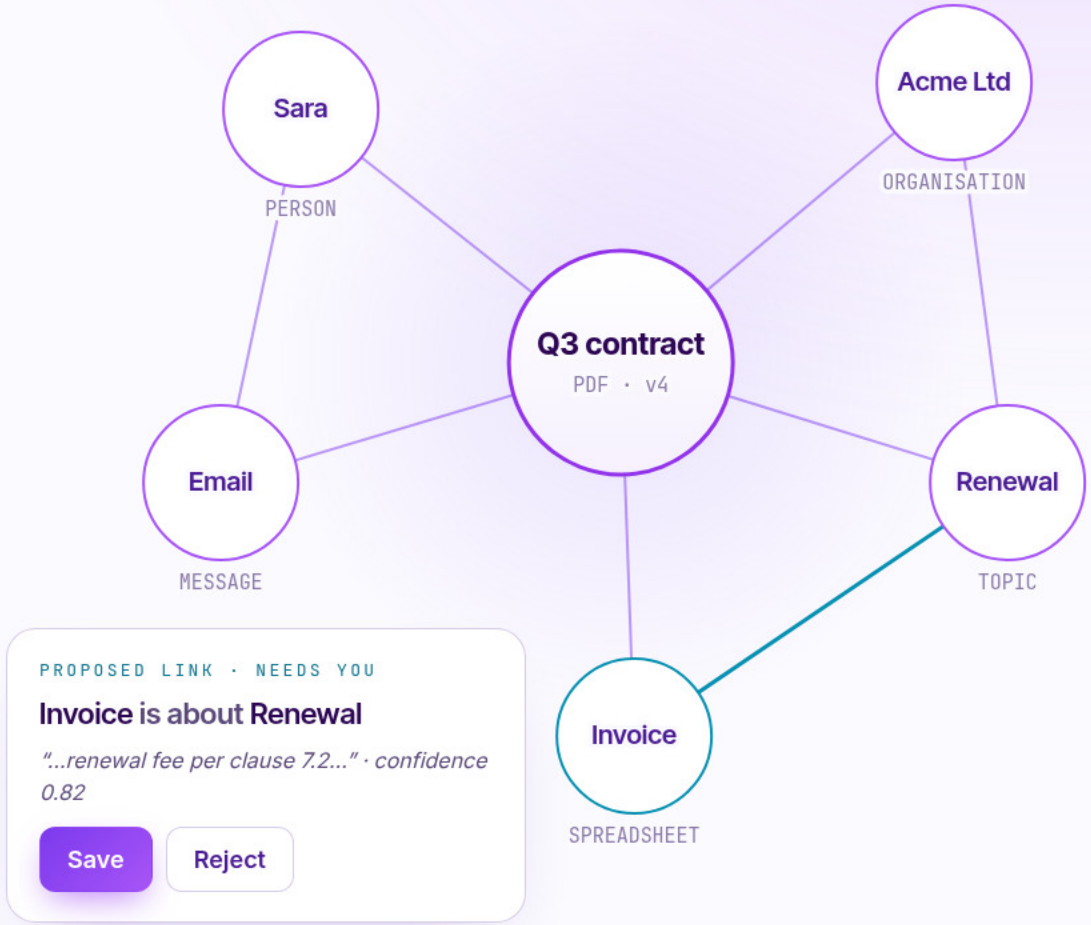

Watches for changes and does a full check every 15 minutes. Every file keeps a version history.

Sorted with open standards

Files are sorted into a shared vocabulary based on DCMI, schema.org, NEPOMUK and IPTC.

A person reviews every link

Suggested links come with an excerpt and a confidence score. You choose **Save or Reject**.

TODAY · BRING ANY BRAIN

Any model. Your key. Your choice.

- Automatic · Laya · OpenJev
- Offline router · works with no internet
- Fast · Standard · Deep per helper
- Local models download in-app

THE POINT

The model is a guest. When a better one arrives, **the memory, the files and the team stay put.** No contract with one model is the moat.

TODAY · WHERE LIFE ALREADY HAPPENS

It works where you already are.

WhatsApp & Telegram

Built into the app. People sync into one directory. Messages are prepared, then wait for **Send**.

Google, switch by switch

Gmail only makes drafts. Calendar adds events without inviting anyone. Drive, Contacts and Tasks each have their own switch.

Any MCP tool, plus web search with no key

Add a tool by web address, by local program, or by pasting a setup from Claude, Cursor, VS Code or Zed.

TODAY · THE PERSON STAYS IN CHARGE

Nothing happens behind your back.

Sovra wants to run a command

```
$ brew install pandoc
```

Changes this computer. Installs a document converter. Output streams live and you can press Stop at any time.

Allow once | Always allow | Don't allow

Email draft saved in Gmail

To: Dana · Acme procurement
Subject: Renewal — proposed terms

"Hi Dana, ahead of Thursday, here are our proposed renewal terms for the next two years…"

Open in Gmail | You press Send

Ready to send on WhatsApp

To: Sara (Legal) · **When:** Thursday 08:30

"Reminder: Acme renewal call at 9. Contract notes are in the shared folder."

Send | Edit | Cancel

HARD RULES

Dangerous commands such as **rm, sudo, curl | sh** are asked about every time and never remembered. Strangers who message your bot get general answers only, with **no memory, no files and no tools.** Keys live in the OS keychain.

TODAY · HOW IT IS BUILT

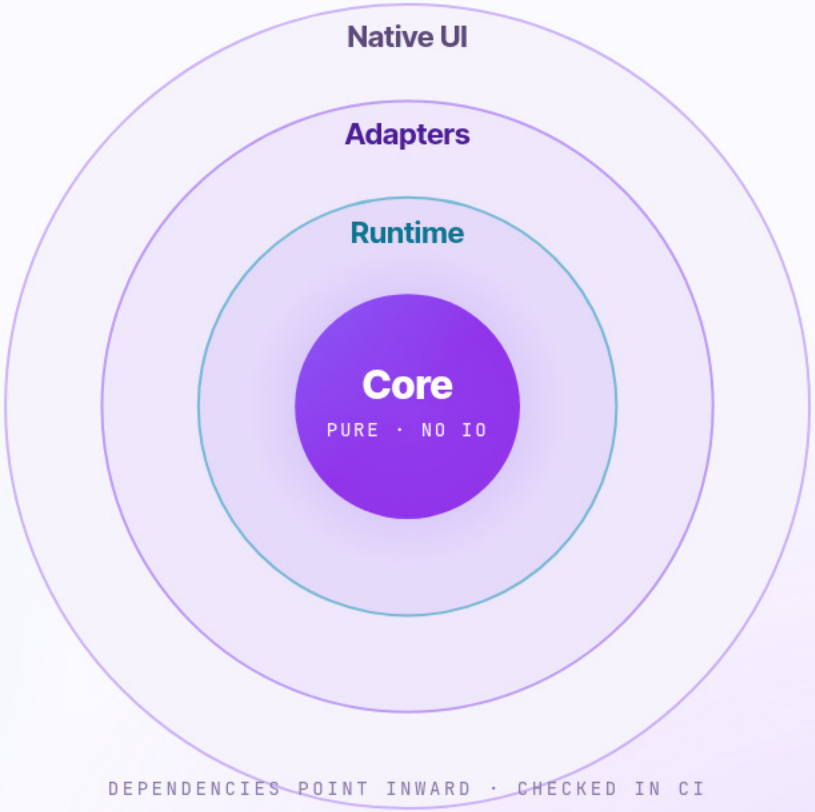

Built like infrastructure. Not a demo.

154,194

COUNTS FROM THE REPOSITORY, NOVEMBER 2026

PART TWO · THE DIRECTION, NOT TODAY

The company becomes the network.

Every computer is a node. Memory is shared like a ledger. Models are trained **where the data already lives.**

THE INSIGHT

Sovra's memory already has the shape of a ledger.

SOVRA MEMORY · TODAY	COMPANY LEDGER · DIRECTION
Append-only facts	Append-only blocks
Four timestamps on every fact	Ordered, time-stamped history
The source of every fact is kept	Signed by the computer that learned it
Corrections supersede and never erase	Agreement on the current belief
On one computer	On many computers, with no centre

WHY IT MATTERS We don't need to bolt a blockchain onto AI. **We take a data model we already ship on one computer and run it on many.**

DIRECTION · ORGANISATIONS AS A CHAIN

A ledger without a coin.

Only invited computers can join. There is no mining, no token and no public chain. What you get is **company memory that shows any tampering** and proves where every fact came from.

BLOCK 4,810

prev 2b9e...c104

BLOCK 4,813 · FORMING

+ New starter: Leo
+ Ticket #882 resolved
...

waiting for agreement

- Each block seals the one before
- Every fact traces back to its source
- Facts are replaced, never erased

DIRECTION · FROM ONE LAPTOP TO COMPANY TRUTH

How a detail becomes company truth.

01

Learn

A laptop learns something new from a chat, a file or an email, and keeps the source.

02

Sign

The computer signs the fact with its own key, so everyone can see who said it.

03

Share

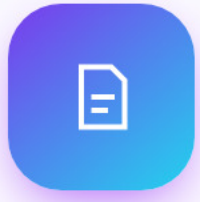

It goes straight to the other computers that are allowed to hold it, encrypted on the way.

04

Agree

A small group of computers agrees on the current belief. Older versions become history.

05

Cite

Anyone allowed can open the proof: who learned it, when, and from which original.

ONE MACHINE OFF?

The rest carry on. When it comes back, it **catches up from the chain**. No single server can take the company's memory down.

DIRECTION · NEED-TO-KNOW BY DESIGN

Everyone shares. Nobody overshares.

Lanes, not one big pool

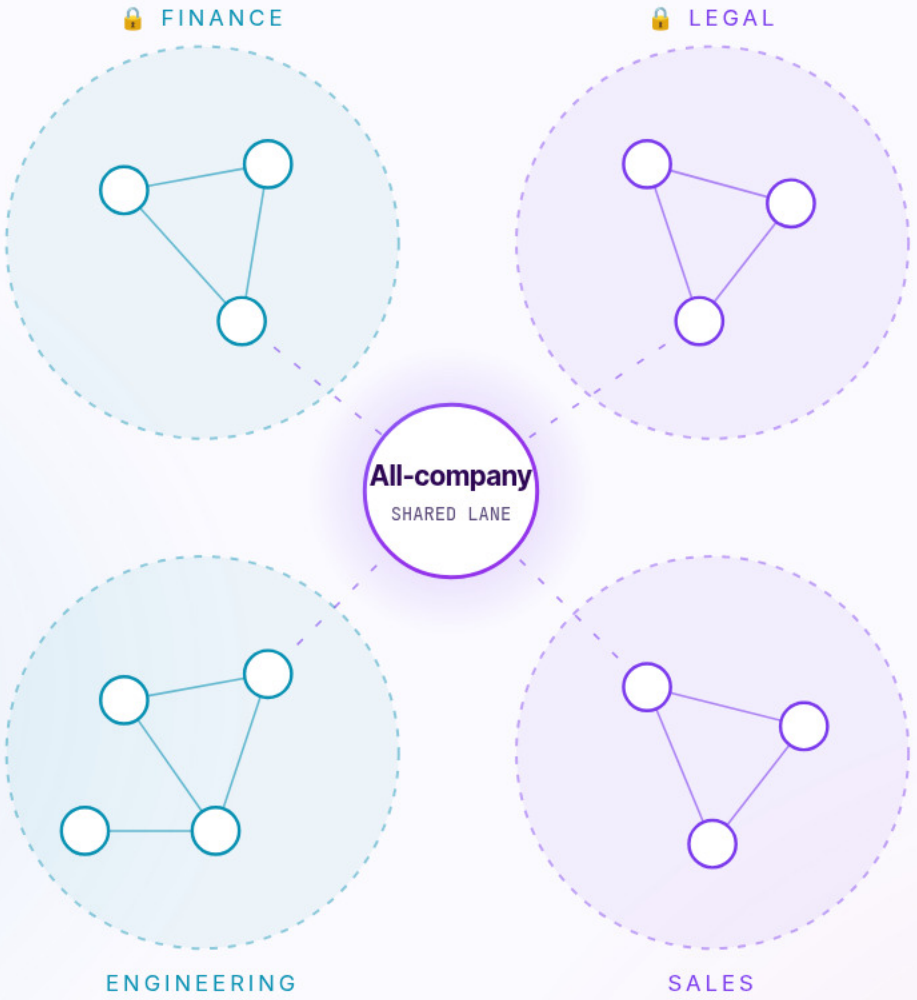

Every fact says who may read it. Finance facts only travel between finance computers.

Keep data in its country

A lane can be pinned to one office, one country or one building, so the data stays where the law says.

Leaving means leaving

Revoke a person or a device and their key stops working. The history of what they added stays.

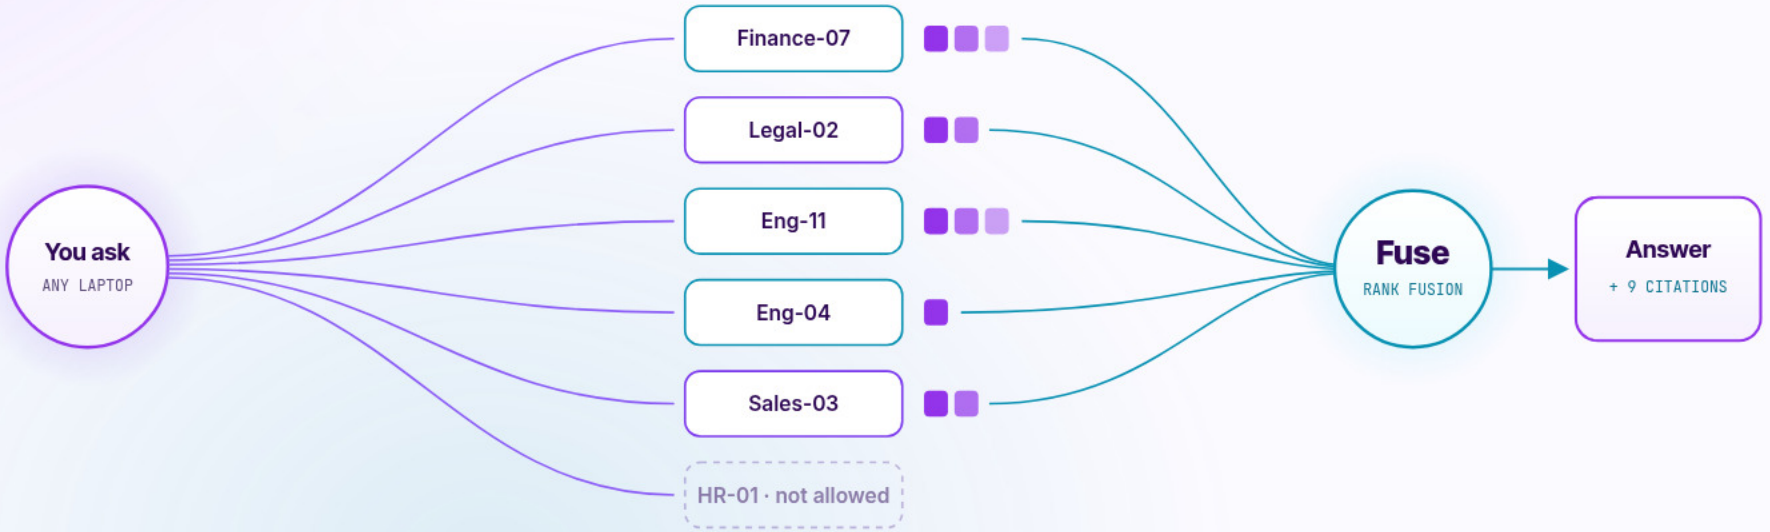

WHERE THIS SITS

The best of a ledger, with none of the crypto.

	CLOUD AI SERVICE	PUBLIC BLOCKCHAIN	SOVRA COMPANY LEDGER
Where the data lives	Their servers	A copy on every stranger's computer	**Your own computers**
Who holds the keys	The vendor	Whoever has the wallet	**Your people and devices**
Can history be rewritten?	Yes, quietly	Never	**Never · replaced with proof**
Coin, mining, fees	—	Required	**None**
Works with no internet	No	No	**Yes · each computer works alone**
Speed	Fast	Slow · the whole world must agree	**Office-network fast · a small group agrees**
Who the model learns for	Their model	—	**Your model, on your machines**

DIRECTION · DISTRIBUTED SEARCH

Ask the whole company. Copy nothing.

Search where it lives

Each computer searches its own memory and files. Only the **best few excerpts** travel, and only to people allowed to see them.

No search warehouse

There is no central copy of the company to breach, pay for or keep in sync.

Already half built

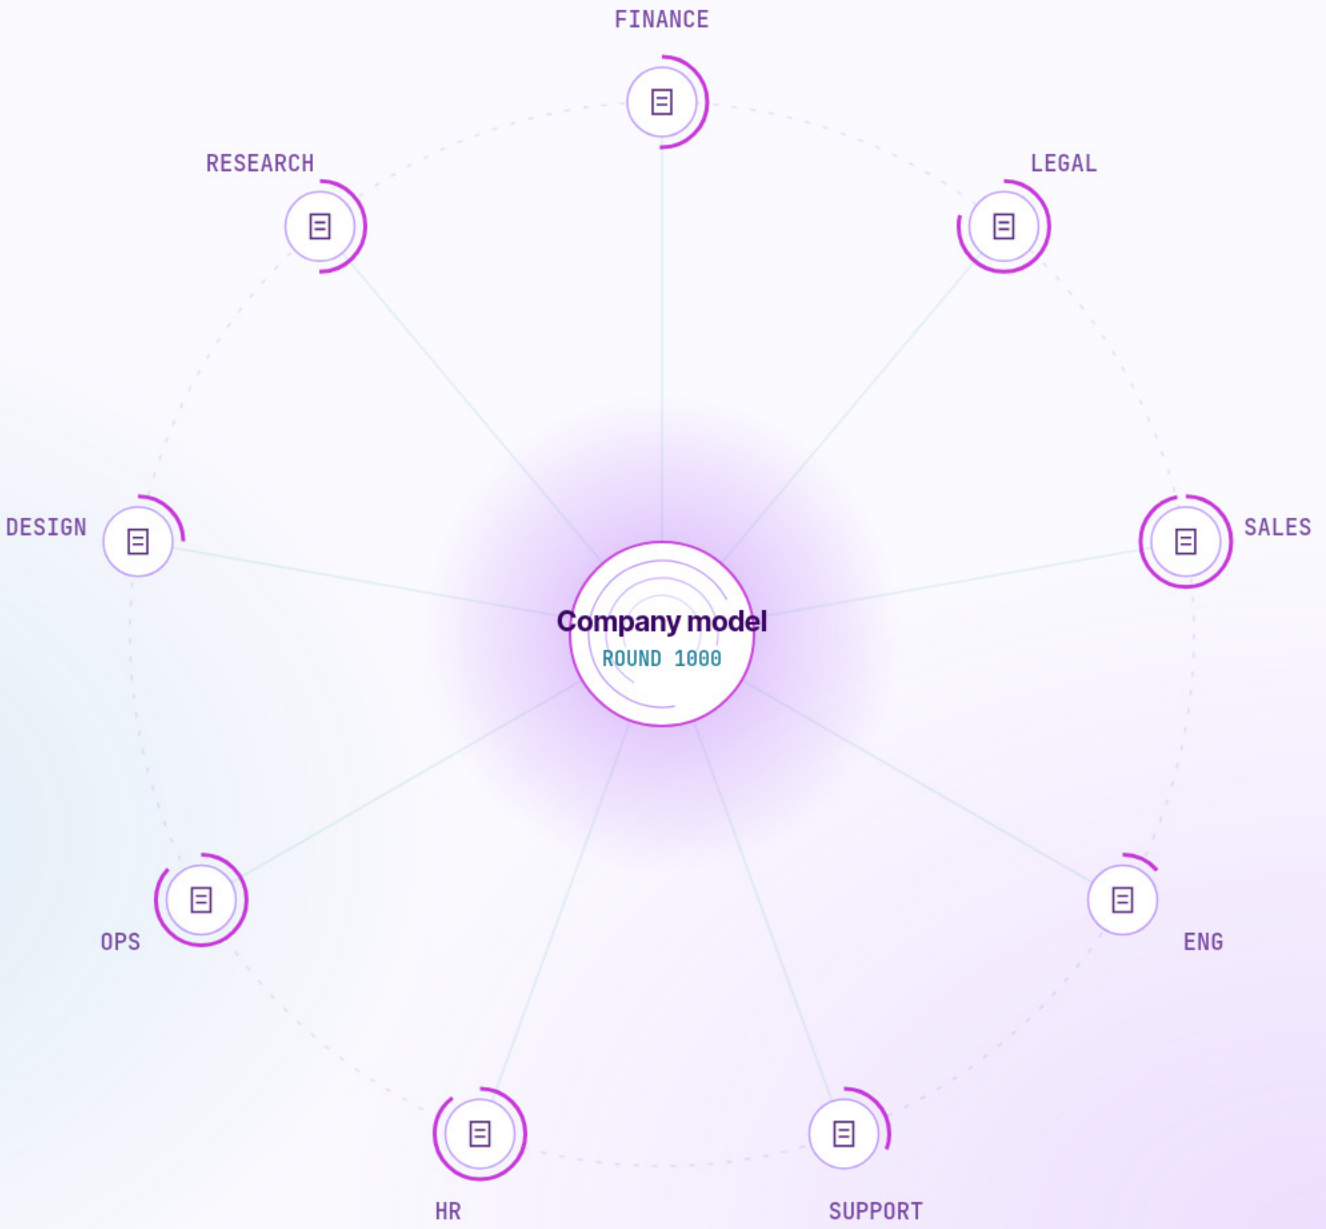

The rank-fusion step that merges results **already ships in Sovra's core** today. Running it across a fleet is the next step.

DIRECTION · DISTRIBUTED TRAINING

Proof of learning.

Idle computers teach the company's own model overnight. **The files never move.** Only a blurred lesson travels, and every round is written to the ledger.

- Each computer trains on its own files
- Only a blurred, noisy update flies in
- The shared model improves round by round

DIRECTION · HOW A TRAINING ROUND RUNS

Your company trains its own model.

01

Wait until it's idle

Plugged in, idle, out of hours. It uses **whatever chip is there**: a graphics card, a Mac, or just the main processor.

02

Learn locally

Each computer trains a **small add-on to the model** using only the facts and files it is allowed to hold.

03

Blur the lesson

The update is clipped and noise is added on purpose, so no single document can be rebuilt from it.

04

Combine blind

Updates are combined so that the merge only sees the **sum**, never any one computer's update.

05

Prove it helps

The new model is tested against the company's own held-out tests. **A round that doesn't improve it is rejected.**

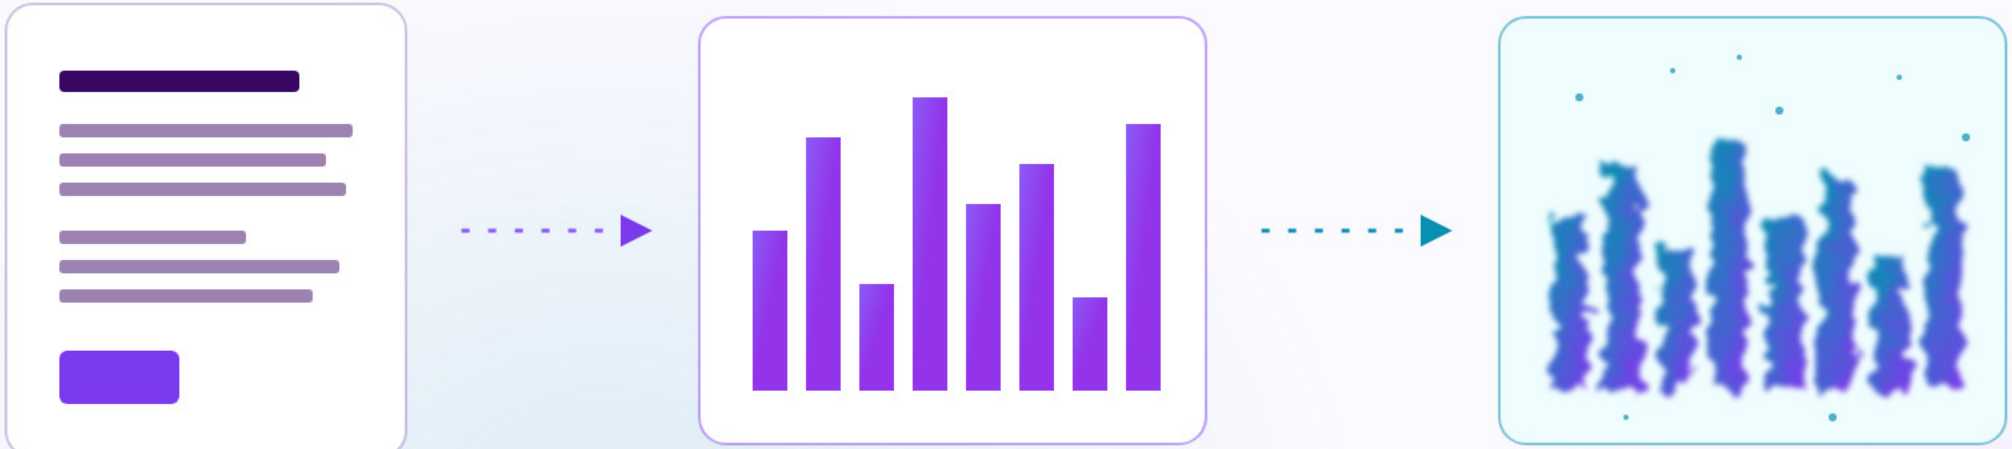

06

Record, then roll out

The round, who took part and the test score go on the ledger. Every computer gets the update, and **you can roll back at any time.**

DIRECTION · PRIVACY OF THE LESSON

See the lesson. Still can't rebuild the file.

STAYS ON THE LAPTOP

RAW UPDATE · NEVER SENT

BLURRED LESSON · TRAVELS

STAYS The files, on the computer that owns them. **Never part of the lesson.**

TRAVELS A small, noisy update. Useful to the model, **useless as a copy.**

Finance and engineering hold very different data. Each lesson is steered back towards the shared goal, so **no one team pulls the model off course.**

DIRECTION · EVERY MODEL HAS A FAMILY TREE

You can audit what your AI learned.

Ask what it learned from

Every round lists which lanes took part and how the score changed. You **never** wonder where a habit came from.

Roll back in one step

A bad round never ships. If something slips through, every computer goes back to the last good round.

Ready for auditors

Regulators ask how a model was trained and on what. **The answer is already on the chain.**

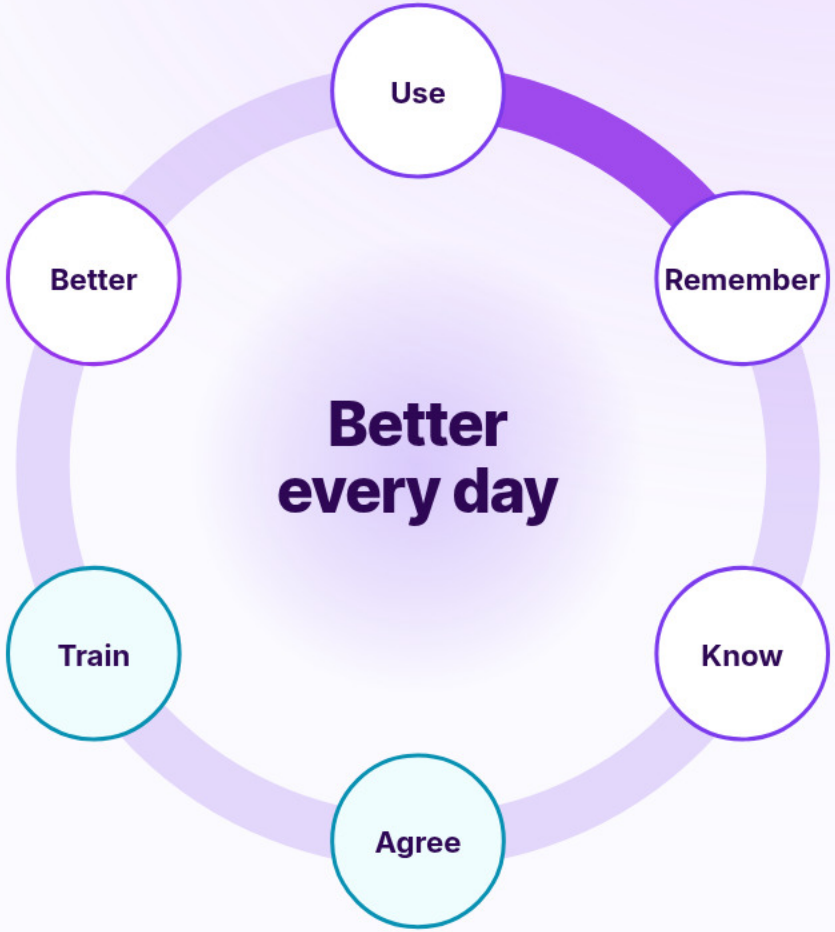

THE FLYWHEEL

Every day of use makes it harder to leave.

Rented chat has to be taught again every time. A computer that remembers, and a company that learns without moving its files, **compounds.**

USE · REMEMBER · KNOW = TODAY

AGREE · TRAIN = DIRECTION

ONE PROGRAM, EVERY SIZE

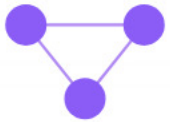

From one laptop to a whole company.

TODAY

A person

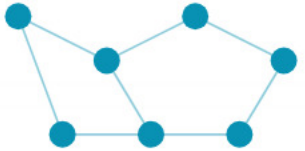

A private team on their own laptop that remembers their life and keeps their files at home.

NEXT

A team

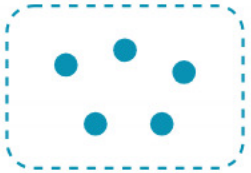

A few computers share helpers and memory. A busy laptop hands heavy work to a free one.

DIRECTION

A company

A private fleet with ledger memory, lanes for each team, and a model trained on its own computers.

DIRECTION

Regulated work

Health, law, finance, government: data that must not leave. Here, **it never has to.**

WHAT IS BUILT, AND WHAT IS NOT

The computer is here. The fleet is next.

NOW · SHIPPING

Sovereign computer

- Native app on macOS, Windows and Linux
- A team of helpers and 49 skills
- Memory with receipts; files read in place
- Chat apps, Google, MCP, terminal, all with approval
- Any model, local or cloud

NEXT · DIRECTION

The private fleet

- Computers find each other and prove who they are
- Ledger memory: signed, agreed, kept as history
- Lanes for each team and data kept in its country
- Search across the fleet with nothing copied

SCALE · DIRECTION

Proof of learning

- Idle computers train the company's own model
- Blurred lessons that are combined blind
- Rounds that don't pass the tests are rejected, and you can roll back
- Every model's history on the chain

NOT YET

The app can't update itself yet. Signed builds aren't in every release. Meaning search runs locally only if you set it up. Google is capped at 100 users until verification. **We say so on purpose.**

— THE CLOSE

Own the house. Choose the guest.

Today: a private team on the computer you own.
Next: a company that remembers and learns **across its own computers**, without sending a single original file away.

NEXT STEP
Run it on a computer you own

JUDGE
The product first, then the path
